Statistics: Mean 7.030; Variance 1.506; scale 4.668

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             representing the following areas of the brain: frontal, parietal, temporal and occipital cortex from the left and right hemispheres,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              constructed by Bento Soares and M.Fatima Bonaldo. The adult brain RNA was provided by Dr. Donald H. Gilden. Tissue was acquired 17-18 hours after death which occurred in consequence of a ruptured aortic aneurysm. RNA was prepared from a pool of tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RI sites of a modified pT7T3 vector (Pharmacia). Library went through one round of normalization to a Cot = 53. Library

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC as a template. The 228 bp amplified fragment contains the H6 promoter CC and the 5'-most bases of the murine p53 gene. Fragment II was produced CC using primers MM082 and MM083 and plasmid p11-4 as a template. The 129 CC bp amplified fragment contains the 3' end of the H6 promoter, the 5'-most CC bases of the murine p53 gene, and 15 bp which overlap fragment III. CF fragment III was produced using primers MM084 and MM085 and plasmid CC p11-4 as a template. The 301 bp amplified fragment contains the 3' end CC of the p53 gene, and the 5' end overlaps fragment II. The three PCR CC products were pooled and primed with MM080 and MM085. The resultant 588 CC inserted into pNC5LSP5 to generate plasmid pMM148 containing H6 promoted CC inserted into pNC5LSP5 to generate plasmid pMM148 containing H6 promoted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Š

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  murine; interleukin-2; II-2; pRW825; pmut-1; pBS-SK; pMM151; TK vector; plasmid; vaccinia; H6 promoter; amplify; primer; antigenic response; polymerase chain reaction; poxvirus; pSD542; immunological response;
                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the wildtype murine p53 gene from the translation initiation codon to the stop codon. This sequence was used in the construction of an ALVAC-based recombinant virus containing the wild-type murine p53 gene. Three PCR fragments were generated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    JT 2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

Human p53 cDNA (given in Q97854) was amplified from a HeLa cell cDNA library using the primers given in Q97852-53. The gene was subcloned into a baculovirus vector for expression of recombinant p53 in Sf9 insect cells for use as a component of

The viruses may be used in a composition for inducing an antigenic immunological response, ie. for immunisation against pathogens. Sequence 1483 BP; 367 A; 415 C; 372 G; 329 T; Q67864 standard; plasmid, ALVAC, to give vCP207, vCP193 and vCP191 recombinant gene. The expression cassettes generated by linking the vaccinia H6 promoter and the p53 genes may be cloned in to the poxvirus insertion mutant genes were derived from plasmids p53wtXbaISP6/T3, p53-21XbaI and p53-238XbaI respectively. The vaccinia H6 promoter was derived from plasmid pRW825 and precisely linked to the 5'-most region of the p53 construction of poxvirus based recombinant viruses expressing wild type and mutant forms of the human p53 gene product. The wild type and containing the vaccinia H6 promoter and the wild type human p53 in vP1101 and vCP207, respectively. These sequences were used : DNA encoding cytokine and/or tumour associated antigen Example 15; Fig 18; 232pp; English.

Claim 9: Column 30; 22pp; English.

This preferred mixed oligonucleotide encodes a ballast constituent and is inserted between a regulatory region and the structural gene encoding a desired protein, esp. pro-insulin. The short ballast component improves protease resistance of the fusion protein while still allowing the desired protein to adopt its correct conformation prior to cleavage of the ballast constituent.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New antibodies specific for alternatively spliced mammalian p53 -
useful in diagnosis or prognosis of cancer, and for establishing
individual treatment regimes.
Claim 5; Page 25; 40pp; English.
R92698 is an epitope from intron 10 of the human p53 gene. Antibodies
directed against this sequence in an alternatively spliced p53 are
useful in diagnosis and prognosis of human cancer. Antibodies against
the epitope may be used in the study of p53 and alternatively spliced
p53 (p53as) and their expression, when the antibodies are injected
into cells they may cause cell cycle arrest. Vectors contg. p53as
cDNA may be used in gene therapy of cancers and other proliferative
disorders e.g. psoriasis.

NN-PSDB; Q87978.  The colk sequence Q19798 is consistent with an approx 6,500 nt DHP receptor (alpha)1 mRNA. It is 94% identical to the cDNA sequence encoding the DHP receptor reported by Tanabe et al., Nature, 328:313-318, 1987. Nt differences were identified at 33 posns, of which three (see FT) also result in AA changes (see R73055 FT). The deduced AA sequence yields a calculated Mr of 212,413,in contrast to the observed Mr 155K-170K, previously reported by others using SDS polyacrylamide gel electrophoresis. The AA sequence is 99.8% identical to that described by Tanabe et al. It contains four internal repeated sequence regions. It has been proposed that the segments of the four internally repeated regions represent 24 transmembrane segments. A eukaryotic cell expressing a chimaeric cDNA is claimed, in which the first cDNA is selected from the gp. consisting of cDNA that encodes a protein that has the AA sequence in R73055 but with the Tanabe et al substitutions indicated in FT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human alpha 1D subunit was obtd. Full-length clones were then constructed by ligating partial clones. Q84653 shows the nt sequence of the CNN encoding the alpha 1D subunit. The Albha 1D protein has a calculated Mr of 245,163. It contains four putative internal repeated sequence regions which represent 24 putative transmembrane segments. It mediates DHP-sensitive high-voltage, long-lasting

Non-A, non-B, non-C, non-D, non-E Hepatitis virus reagents - useful for diagnosis and therapy of hepatitis GB virus
Example 9; Pages 343-357; 661pp; English.
Double stranded hepatitis GB virus (HGBV) DNA obtd. from HGBV infected tamarin plasma, using standard procedures, was used to prepare a lambda phage HGBV cDNA library. Clones were rescued from the lambda phage, searched against a sequence database and found to be unique HGBV sequences. The clones were then used to assemble the sequences T00129/30 (GB contig A and B) which encode the proteins R94345-47 (the 3 possible coding strand reading frames) and R82072, respectively. Reagents which comprise the HGBV DNA, or its protein prods. can be used for the diagnosis, therapy or in a vaccine to prevent HGBV infection. R94346;

Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Mean 28.995; Variance 36.679; scale 0.791

SKELETAL MUSCLE CALCIUM CHANNEL

CYPRINUS CARPIO (COMMON CARP).

ALPHA-1 SUBUNIT.

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
-!- PTM: MAY NOT BE PHOSPHORYLATED.
-!- TISSUE SPECIFICITY: SKELETAL MUSCLE.

-!- SIMILARITY: TO OTHER CALCIUM CHANNEL ALPHA SUBUNITS

DIHYDROPYRIDINE (DHP), A CALCIUM CHANNEL BLOCKER.
-!- SUBUNIT: THIS L-TYPE CALCIUM CHANNEL IS COMPOSED OF TWO SUBUNITS:
ALPHA-1, AND ALPHA-2.

-!- FUNCTION: CALCIUM CHANNEL PROTEIN WHICH PLAYS AN IMPORTANT ROLE EXCITATION-CONTRACTION COUPLING. THE ALPHA-1 SUBUNIT BINDS

Statistics: Mean 27.793; Variance 45.751; scale 0.607

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

cDNA clones; p176 (bp 1-1247), p271 (bp 69-638), p422 (bp 1288-1719), and p208 (bp 1432-1719) [1]. There is only one functional p53 gene in the mouse genome.

p422

sequence of the murine p53 psuedogene, also reported by [1] (see separate entry), and the cDNA sequence are almost identical from nucleotide 186 onward. Upstream of this position the two sequences

gene, mostly due to post-translational modifications [1]. The existing different forms of murine p53 must be products of the same

the two sequences differ by only 4%. The differences are due to

substitutions and to some small deletions or additions in this gene deverge totally and no homology can be observed; downstream of here

Statistics: Mean 7.360; Variance 1.481; scale 4.970

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. derived by analysis of the total score distribution.
